

ABSTRACT

An exemplary cleaning apparatus for cleaning a system having a first fluid is provided, wherein the apparatus comprises a second fluid entering the system and cycling in the system with the first fluid for a predetermined period of time. The cleaning apparatus also comprises an air compressor and an air storage tank. The air compressor is capable of compressing air into air storage tank, and air storage tank is capable of delivering air to the system for purging the first and second fluids from the system after the predetermined period of time has expired. The cleaning apparatus further comprises an air regulator capable of regulating pressure of the air delivered to the system.
